

SCORE

Drawing → Listening

THE IDEA

What if a drawing could be heard?

SCORE treats visual marks as musical notation — not metaphorically, but computationally. Every line, shape, and tone carries latent acoustic information waiting to be decoded.

Draw

Input a hand-drawn or generated image into the system

Analyse

Extract visual properties — edges, density, color, form

Compose

Map those properties to musical parameters in real time

Three-Stage Architecture

Each stage is modular — designed to be swapped, extended, or retrained independently without breaking the pipeline.

PARAMETER MAPPING

Visual Property → Musical Parameter

Visual Property	Musical Parameter	Range
Edge density	Note density / rhythm	sparse → dense
Brightness	Pitch register	low → high
Color hue	Timbre / instrument	warm → cold
Contour direction	Melodic contour	descent → ascent
Spatial mass	Amplitude / volume	soft → loud
Texture roughness	Harmonic dissonance	consonant → dissonant

Skills & Study Time

Processing**JavaScript****Python / CV****Tone.js**

Stack & Build Plan

Week 1 — Image Input

Processing sketch, canvas capture, edge detection

Week 2–3 — Mapping Engine

Python CV pipeline, parameter extraction, JSON bridge

Week 4–5 — Sound Layer

Tone.js synthesis, real-time playback, UI integration

1

Processing

2

Python + OpenCV

3

JavaScript

4

Tone.js

5

p5.js

NEXT STEPS

What's Coming

ML Mapping Model

Train a lightweight model to learn non-linear visual-to-audio relationships

Real-Time Feedback

Live canvas that updates audio as the drawing changes

Expressive Synthesis

Extend Tone.js layer with granular and FM synthesis modes

Browser UI

Clean, minimal web interface — draw and hear, no setup required

Export & Share

Export generated audio and save image-score pairs

Documentation

Write up methodology, mapping logic, and creative findings

Every image contains a latent piece of music.

SCORE makes it audible.
